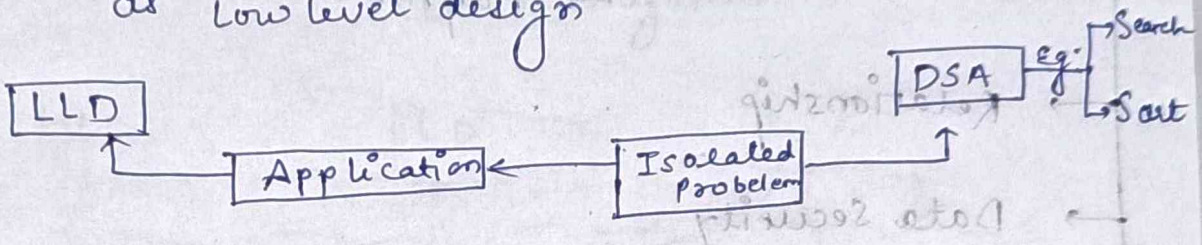
Lecture-1

Introduction to system design.

Q- What is LLD?

LLD stands for low level design.

→ When we build an application around DSA concepts or solution then it will known as Low level design



Person-1

DSA ✓

LLD X

Person-2

DSA ✓

LLD ✓

Question problem- Develop ride sharing/booking app

Problem 1- To reach source to destination

→ use graph ques solved

Problem -2 Assign rider implement priority queue and assign closest rider to ~~m~~ user.

r1	r2	r3	r4

If person 1 submit this then manager says its a solution where is the implementation

Problems done under LLD + DSA

→ All DSA problem

→ objects/ entities

→ Relationship

→ Data Security

→ Notification

→ Payment

→ Millions of User

Let's check How person2 deal with it

How Person2 Handles it -

→ first we have to design the structure

- → object/entities
  - → User
  - → Rider
  - → Location
  - → Notification
  - → Payment
- → Relationship
- → Data Security
- → How to handle scalability with millions of user?

& when he prepares the structure then he jumps ~~over~~ at the DSA Part.

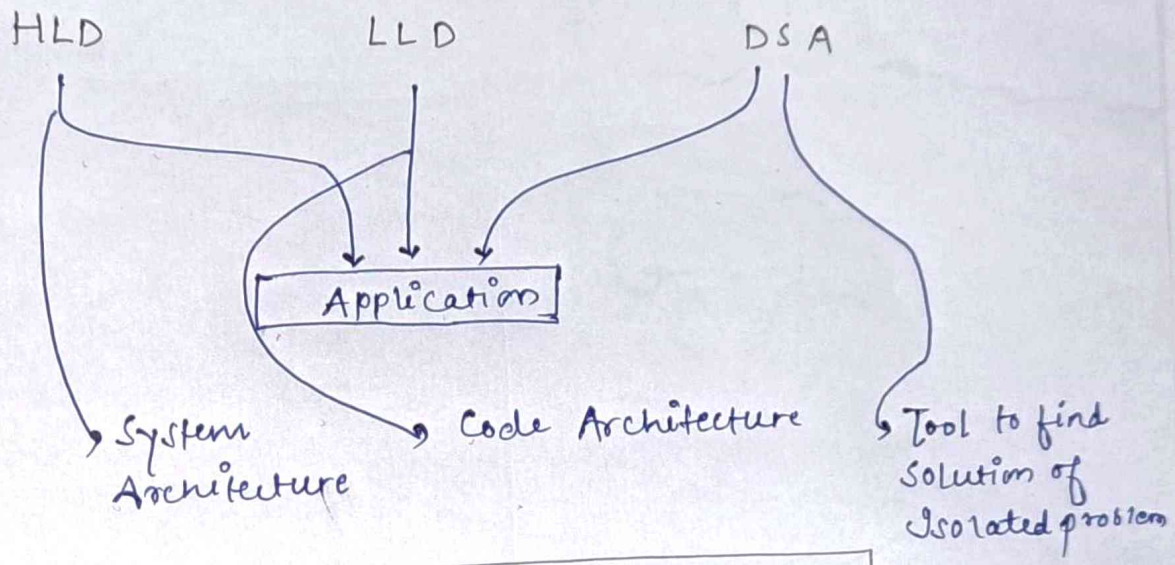
Main goals of the LLD -

- → Scalability
- → Maintainability
- → Reusability

Q- What is not LLD?

HLD : High level Design

- Tech stack (Java/ Javascript .....)
- Database (SQL / NoSQL .....)
- Server Scaling
- Cost optimization



DSA is the brain of an Application
LLD is the skeleton.
